

Senior Blockchain Engineer

saito.tech

Role: Blockchain Engineer (this is a senior role)

Key Responsibilities

- Master the Saito software application and blockchain design principles
- Manage and own the software stack
- Work with the core team to build a roadmap for technical improvements
- Follow best practices in coding and project management
- Community outreach and engagement with outside developers

Details:

We are seeking a candidate capable of stepping into Saito development at a high level. Experience with blockchain development is desirable but not a hard requirement. Thorough understanding of blockchains and associated cryptography and programming techniques is. We expect anyone joining our team to be capable of learning the key concepts driving Saito and be able to implement those concepts in our software client as needed.

Core programming work will focus on improving our node.js Saito software, with a focus on improving the speed, efficiency and scalability. Our focus for the next year will be shifting our single-threaded application to a multi-threaded or micro-service architecture, and securing the network against malicious block-flooding and memory-exhaustion attacks. Candidates are expected to be able to grow into experts in the consensus mechanism and its software implementation.

Remuneration

Base Salary: to be discussed

Generous Token/Equity Package

Benefits:

- Health and Travel Insurance
- Relocation costs considered.
