

Saito

Introduction/Update &
Roadmap

Saito is a Blockchain that Works

Fixing the fundamentals and incentivizing growth

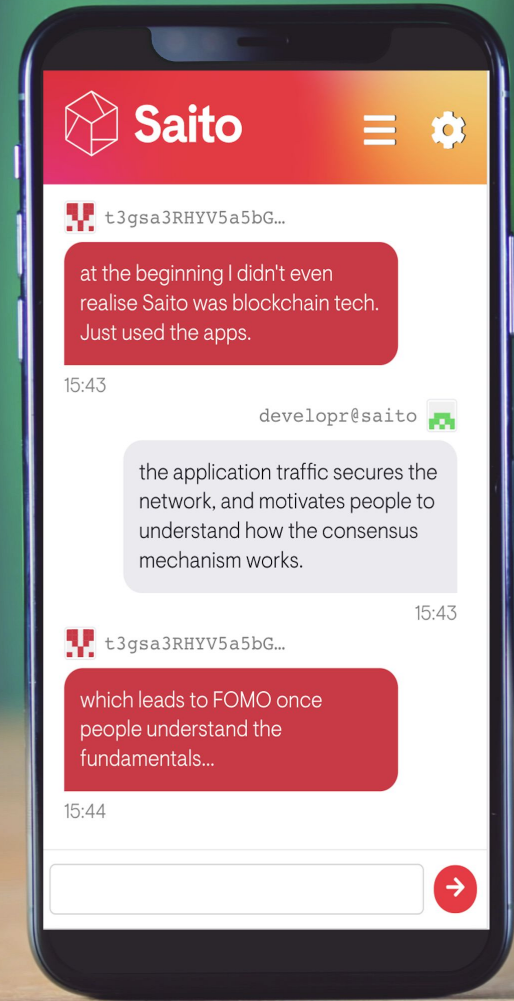

Saito Blockchain

An entirely new class of blockchain with no economic, 51 percent, sybil or discouragement attacks.

Saito consensus mechanism provides double the security of POW / POS and eliminates the need for separate fees to pay for network infrastructure.

The solution emerges from simplicity not complexity. No DAG / validator-ring / lamport-slashing / sharding convolution.

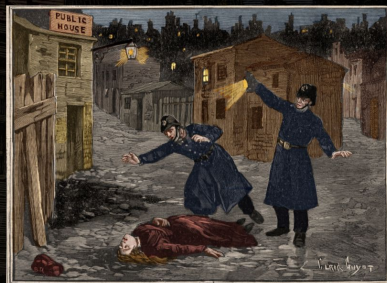

Saito Applications

Standalone Applications

Web or native

Rich and full featured

Mix on-chain / off-chain data

Scotland Yard

A cat-and-mouse mystery game in which criminal mastermind Mister X must evade the London Police while hiding from Scotland Yard.

This Saito edition is modified to improve the balance of gameplay. If played with less than six players, the defenders will control multiple detectives to increase the effectiveness of surround-and-capture strategies.

I have seen the future and it is Saito....

FROM: peterb@saito

TO: dominico@saito

The mad lads have done it -- they've solved the collective action problems (tragedy-of-the-commons, free-rider) at the heart of blockchain scaling. The solution makes proportionality of payment the first order problem and uses the distribution of funds to impose cost-of-attack on blockchain production. Come you know, but it was not obvious.

The application model is another jewel. Instead of running smart contracts on the base layer, Saito applications send-and-receive data directly on-chain. We can still use smart contracts where we need them, but I don't think we need them anymore. The modular approach is simply faster and better: a bit like they've invented UNIX in a world where everyone is stuck programming JAVA widgets on Windows machines.

I can see now that we just need a single developer. Throw out that complicated architecture Bill setup -- I'll code a small module (100 lines of code?) that adds some buttons to Saito's existing apps like email and wechat. Once we have a workflow in place that's when we can build our standalone front-end. And the beautiful thing is that we won't even need to run a server since the apps run directly in the user wallets.

We should move quickly. Volunteer-powered networks may work at small-scale, but for big-data networks we need the scaling solution that Saito introduces. They've already patented the fundamental cryptographic techniques, so there will only ever be one public chain. We will need to talk about this in person. I am excited about blockchain again. Talk soon.

Modular Systems

Mix existing and custom functionality to build just about anything.

Rapid Development

Saito and its core modules handle transaction processing, peer management, on-chain and off-chain relays, QRCode scanning and more.

Saito offers native support for 350,000+ npm modules to allow full integration with your team and custom stack.

Modular architecture permits rapid iteration, real-time upgrades and separation of data-flows from UI and UX software.

We can build you a prototype in days not months.

Real World Deployments

DHB Global partnered with Saito to develop a supply-chain tracking application to handle medical product sourcing and delivery.

Saito powers their supply-chain infrastructure. Employees process orders and track shipping and fulfillment with a secure browser-based application they can use from their mobile phones.

Enterprise is a key part of Saito's execution strategy. For more information see:

🕒 2020/7/29

Confirmed.
This is so easy to use, the guys in the field are loving it. Can't believe the Saito team turned around those upgrades so fast.

We Seek

Industry Partners

We want best-of-class enterprise applications running on our network.

Our ideal partners are results-focused and want to get their problems solved and solutions deployed.

We are happy to offer courtesy token allocations for introductions to industry partners.

Talk to us about
the problems you
need solved:

IOT and connected devices

Saito Blockchain

The Saito Consensus Mechanism:

- double the security of POW / POS
- half the network operating costs
- blockchain can never collapse from data-bloat

Saito 2020 - Technical Solutions

Saito 2020 - Intellectual Property

Saito Blog - org.saito.tech/blog

“An elegant solution to paying for the network...”

- Andrew Stone (BCH)

“I have to figure out how to add sharding to Saito...”

- Illia Polosukhin (Near Protocol)

“The separation of block production and minting is interesting.”

- Ittay Eyal (Academic, Technion)

Network Performance

Since Jan 1st 2019:

> 3,000,000 transactions

> 850,000 blocks

> 23,000 wallets

> 100 GB of data transfer

Max tx/day: 25,000

Max new users/day: 347

Trans-Pacific Bandwidth:

- 2x 350MB blocks/minute sustained
- 1 terabyte / day

Stability:

- Marathon test: 11MM blocks

We Seek

Smart Capital

A public token sale is coming.

Tokens will be released on a rising price curve. Any unsold tokens will be locked into long-term Coinbase.

This model encourages price appreciation while supporting those who onboard users and applications.

Private Tranche

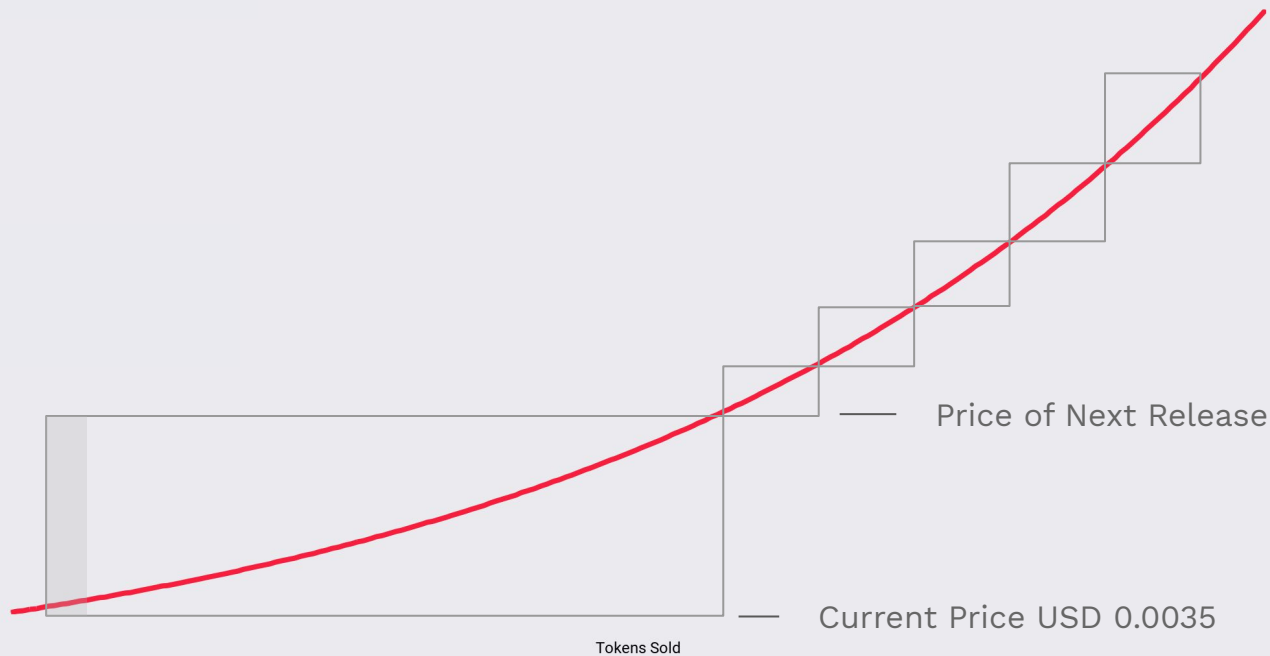

A Limited Opportunity

Saito has acquired active users and a growing community on a small seed round. We have limited tranches available prior to general public available.

For those looking for involvement in what comes next, this is a rare chance to support an industry-defining project on the scale of Bitcoin and Ethereum.

Token pricing and availability subject to conditions of public sales curve.

Saito Token Sale Model

When a tranche is sold out, new tokens may only be purchased at the next price.

Limited tranches available at discount to fund promotion and administration of the sale.

For more details see our: *Saito 2020 - Token Sale*

Token Parameters

Saito Token Distribution	TOTAL	100%	[10,000,000,000]
